

Conflicts and Cooperation in Managing Environmental Resources (Microeconomic Studies)

The use of environmental resources involves strategic behavior of self-interested agents, bargaining, cooperation and other efforts to provoke or settle conflicts. In order to model conflicts and cooperation in managing these resources most papers contained in the book make use of advanced game theoretic concepts. The first six contributions investigate conceptual issues of international conflicts and cooperation while the other four address conflicts and cooperation arising in the context of monitoring and enforcing environmental controls. The emphasis is on demonstrating how new developments in economic (game) theory can fruitfully be applied to important environmental issues. Descriptive as well as normative approaches are presented. In the context of international environmental problems attention is focused on the consequences of non-cooperative behavior and on the incentives for, and barriers to, the emergence of cooperation. Incomplete implementation of environmental controls can be attributed, to some extent, to failures of monitoring and enforcement which, in turn, raises the issue of designing institutional arrangements allowing for (more) effective enforcement. Students and researchers with a working knowledge of economic theory can expect to learn how complex issues of economic-environmental interaction are successfully tackled by advanced (game) theoretic methods.
