

ISO 13885-1:1998, Binders for paints and varnishes - Gel permeation chromatography (GPC) - Part 1: Tetrahydrofuran (THF) as eluent

This part of ISO 13885 is one of a series of standards dealing with the sampling and testing of paints, varnishes and related products. It describes conditions for the determination of the molecular-mass distribution, number-average molecular mass M_n and mass-average molecular mass of polymers that are soluble in THF (tetrahydrofuran) by gel permeation chromatography (GPC). It is possible that, in spite of the good repeatability obtained with this method, it cannot be used with certain polymer types because of specific interactions, such as adsorption within the sample/eluent/column system. The method is not an absolute one and requires calibration with commercially available unbranched-polystyrene standards that have been characterized by absolute methods. The results for samples of polymers other than polystyrene are therefore only comparable within groups of samples of the same type. The conditions specified in this part of ISO 13885 are not suitable for the GPC analysis of polymer samples with M_w values greater than 106 (see annex A). No correction methods, e.g. for the elimination of peak broadening, are included in this part of ISO 13885. If absolute molecular-mass values are required, an absolute method, e.g. membrane osmometry for M_n or lightscattering for M_w , must be used. Also known as size exclusion chromatography (SEC).
